

☯ Immunity Booster To Accompany Veterinary Treatments

Before and after vaccination, pre and post surgery, during and after antibiotic or corticosteroid treatment, but also before and after deworming with chemicals, are all times when your pet's immune system is weakened.

Knowing the side effects and down sides of allopathic treatments, sedation, anesthesia and the impact of an actual illness on the animal's organism and immune system, I have developed cures for my dogs to lower this negative impact and strengthen their natural ability to fight disease. These, too, have become one of the major keys to our dogs' overall wellness and longevity.

Ingredients:

Antioxidants (vitamin A, C, E and Selenium) - 1 capsule/tablet or 1 tsp powdered product

Probiotics – 1/2 tsp or 1 capsule

Enzymes – 1 tablet/capsule or 1/2 tsp powdered product

Psyllium Husk – 1/4 tsp or 1 capsule

Kelp – 1 tsp

Sea Corrals – 1 pinch

Carrageen – 1 tbs cooked jelly

Colostrum – 1 capsule or 1/2 tsp

MSM – 1g (small pinch) or 1 tablet

Raspberry leaves – 1tbs

Dandelions – 1tbs

Use 1/2 tsp of each of the following dried, crushed herbs:

Fireweed

Yarrow

Milk Thistle

Chamomile

Echinacea

Directions:

Put all dried and crushed herbs together in a bowl, steam with hot water and let rest for 10minutes. Mix into your pet's food together with the rest of the supplements.

During recovery after surgeries, illness and antibiotic and other drug treatment give for 4-6 weeks. Give one week before and one week after deworming and two weeks before and 2-3 weeks after vaccination.

For cats and dogs up to 10kg (22lbs) administer half amount.
